

Streamline your retail business with the **DATALOGIC** memor

Why should back-office work be constrained to your back-office PC?

- ✓ **Stock taking**
- ✓ **Price reduction label printing** 
- ✓ **Stock receiving**
- ✓ **Stock transfers**
- ✓ **Product Ordering**
- ✓ **Queue Busting**

Stock taking

Perform live stock takes on your inventory while the store is open and trading. Simply scan a barcode to see the current, live stock figure for the product - then simply adjust this and move on to the next product. Adjustments are recorded in the same way as a stock take so the process is fully auditable. Perform stock takes product by product - there's no longer a need to do them by whole departments or suppliers.

Price reduction label printing

New to SimpleEPOS! Allows clearance barcode labels to be generated on the shop floor and printed to either a mobile label printer or the usual desktop label printer. At the point-of-sale, scanning the clearance barcode sells the product at the reduced price but still accounts for the stock.

Purchase Ordering

Simply scan a product to see the current stock level and quantity already on order. Enter the quantity you would like to order - this is then added to an existing open order on the system for the appropriate supplier (or a new order created, if required). Purchase Orders are fully editable on the back-office PC.

Queue Busting

Process simple cash sales in the queue or scan barcodes and transfer these to the EPOS terminal in an instant. Additional products can be added and corrections made before payment is taken. Ideal for busy periods where a full blown additional EPOS terminal would be over-kill.

Barcode collection for stock control and movement

Simply scan and collect barcodes from deliveries and supplier returns and transmit these to any of the stock processing functions in SimpleEPOS - receive, transfer, purchase ordering, etc.

Supplied as a complete kit, including battery and charger, the Memor is ready-to-run from the box (requires SimplePOS remoteServer module):

The Memor model provided is the WiFi 802.11b/g model with high performance laser scanner. You will require a wireless router or access point - if you do not have one we can supply a USB wireless adapter with software access point for only £20 (simply connect to your PC or terminal).
